

## 1. Message Send in proper line

Way to solve this issue-1.Type Hi,

2.Enter message in 2nd page then it comes in proper format(We can take message from txt file)

3.then enter

## 2.Run Profile in loop

Take profile id, token and port from excel sheet

Sample code(Instagram developer uses this code)

```
import pandas as pd
df= pd.read_csv("Instagram.csv")
```

```

user_list = []
port_list = []
token_list = []
profileid_list = []
df2 = df['UserList'].dropna()
for u in df2:
    user_list.append(u)

df3= df['Port'].dropna()
for u in df3:
    port_list.append(int(u))

df4= df['Token'].dropna()
for u in df4:
    token_list.append((u))

df5= df['Profile_Id'].dropna()
for u in df5:
    profileid_list.append((u))

for i in range(len(profileid_list)):
    main(token_list[i], profileid_list[i] , port_list[i], user_list)

```

### 3. User add error in firebase

This error comes when name contains dot(.) like firebase/kundan.kundan.json then it gives error due to dot contains in name and also there is issue due to special character

Errno 400 Client Error: Bad Request for url:

[https://discordbot-011221-default-rtdb.firebaseio.com/channel4/\\$TR!KER.json](https://discordbot-011221-default-rtdb.firebaseio.com/channel4/$TR!KER.json)

### 4. Loop extra run issue

Due to this browser does not close automatically when task completes it may give error when we run profile in loop.

### 5. bot takes too much time to send 5 message when there is more than 50 online members

Way to fix this issue- we can input start and end point for scrolling. For example we can allot bot starting and end point of user list like bot can only send message from 100 to 200 user. But it should take input from txt file for this.
